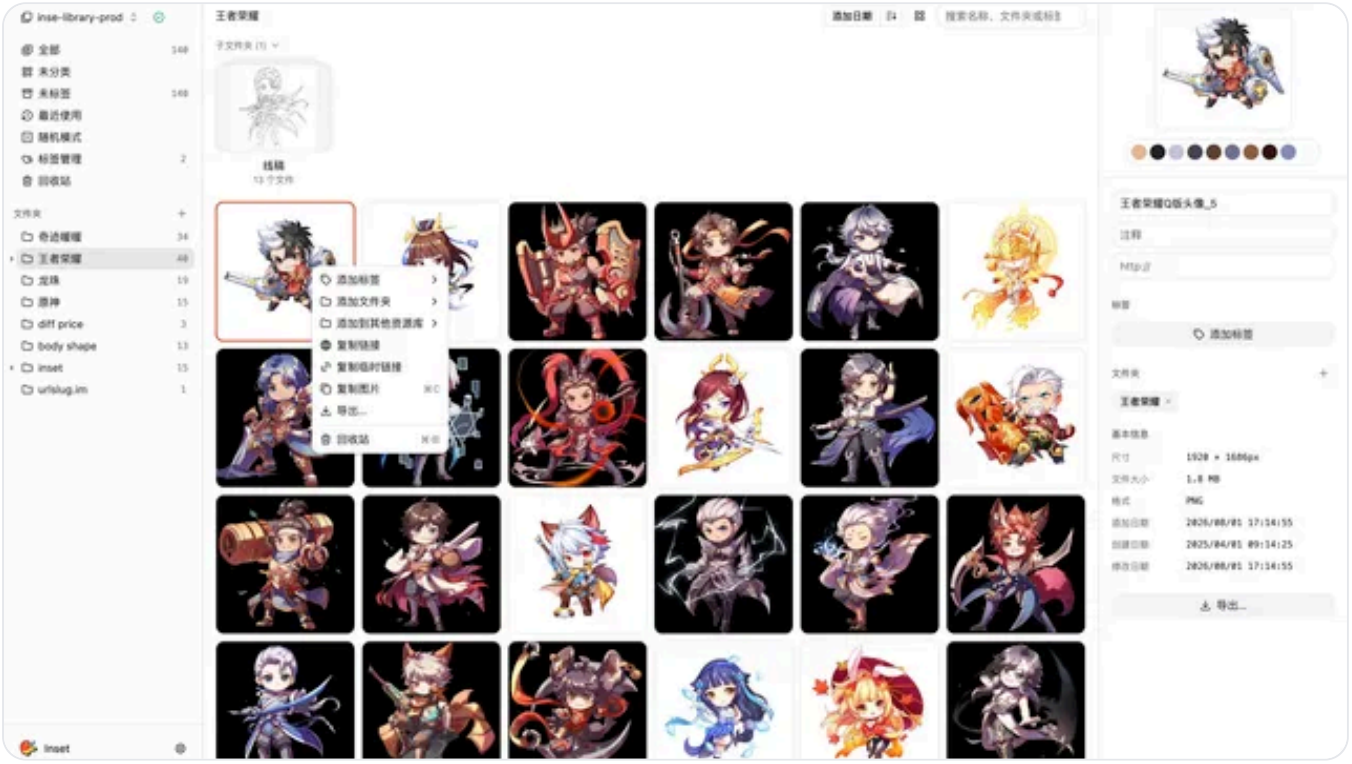
S3 Web Browser for Organizing Assets

Browser-based asset management for Cloudflare R2 and other S3-compatible storage, with previews, folders, tags, notes, and favorites.



About

S3 Web Browser for Organizing Assets is a browser-based way to manage files and assets in Cloudflare R2. It is designed for previewing, organizing, and finding content directly in the web app, with credentials kept in your browser rather than uploaded to Inset servers.

What is S3 Web Browser for Organizing Assets

S3 Web Browser for Organizing Assets is a web app for browsing and managing object

support for S3-compatible storage and providers such as AWS S3, Aliyun OSS, Tencent COS, and MinIO.

The app is built around a browser workspace, so you do not need to install a desktop client to start organizing assets. Its pitch is centered on turning object storage into a more visual, searchable asset library instead of a raw bucket browser.

Key features

- Visual previews for images, videos, design files, and other assets, using thumbnails and preview-first browsing.
- Search and filtering tools to help you locate files faster inside a browser-based library.
- Organization tools that go beyond object paths, including folders, tags, notes, categories, and favorites.
- Local-folder library support and browser library support for organizing content in the web app.
- Object storage connections for S3-compatible providers, including Cloudflare R2, AWS S3, Aliyun OSS, Tencent COS, and MinIO.
- Cloud actions listed in the product materials, such as upload, download, delete, rename, move, indexing, and thumbnail storage, with some features tied to trial or paid plans.
- Direct file access paths so assets can be reused in other tools or workflows.
- Credentials stored locally in the browser, which the site says are not uploaded to Inset servers.

How to use it

- Open the app in your browser and start a workspace from the web interface.
- Choose whether you want to work with a browser library, a local-folder library, or an object storage connection.
- Add files or connect a bucket from a supported S3-compatible provider.
- Use thumbnails, previews, search, tags, notes, categories, and favorites to sort

- Use cloud library actions such as upload, rename, move, or delete when your plan includes them.
- For reuse outside the app, use direct file access paths where available.

The site says the workspace starts only in your browser, so the product is meant to be used as a web app rather than a sync client running in the background.

Who it is for

This S3 browser is a fit for people who manage media or asset libraries inside object storage and want a more visual workflow than a console view.

It may be useful for:

- teams storing images, videos, or design assets in Cloudflare R2
- users who need a browser-based asset manager for S3-compatible buckets
- creators or operators who rely on tags, notes, and folders to keep libraries searchable
- people who want to preview content before downloading or sharing it elsewhere
- users who prefer not to install a desktop application for storage organization

What to know before you use it

- The product page is specific about Cloudflare R2, but it also lists broader S3-compatible support; if you need a provider-specific workflow, check the current compatibility details in the app.
- Some capabilities are only shown as part of the 30-day Pro trial, including multiple object storage connection tools and several cloud actions. Free use is described as local organization and browser library work.
- Pricing is presented as Free, Pro at $29/year, and Lifetime at $174 one-time, but the exact inclusions can differ between free, trial, and paid tiers.
- The app says credentials stay in your browser, but you should still review your own security policy before connecting production buckets.
- This tool is for organizing and browsing assets; for authoritative storage administration, retention policy checks, or provider-level billing and access controls, use the official Cloudflare R2 or S3 provider consoles instead.

If you need a browser-first way to organize object storage, this S3 web browser is aimed at making Cloudflare R2 and other compatible buckets easier to preview, search, and structure.

FAQ

Is S3 Web Browser for Organizing Assets free to use?

Which storage providers does it support?

Does it require a desktop app?

What kinds of files is it best for?

Are my storage credentials sent to Inset?
